

Overview

The project is a multiplayer puzzle game where 2 players need to communicate and cooperate to progress through the randomised puzzles in the game. Players can create/join lobbies. Once the lobby leader starts the game, players are spawned in a dungeon in different rooms. There are different clues available to each player in these rooms which they need to describe/convey to the other player to solve the puzzle. They can communicate by utilising the voice chat functionality to work out the puzzles. The game was made with the Unity game engine where C# and .NET are used for implementing the networking and the functionalities for the game.

Instructions to play:

Find a partner to play with!

You can move around with "**WASD**" keys and jump with the **Space** key. Use your **mouse** to look around.

You are not allowed to look at your partner's screen. Describe your friend what you see on your screen to solve the puzzles!

To restart a game: Press **ESC** and select **Leave Game**. Then remake the lobby. Ask for assistance if you need help remaking the lobby.

Hints:

Starting room: Your friend needs to stand on the pressure plate for you to go through the gate, then you must do the same for them.

1st puzzle: Describe the 4 symbols to match them with a path and follow that path on the pressure plate maze.

2nd puzzle: There are dangerous swinging obstacles that only one player can see. The player who sees them must tell the other player when it is safe to go across.

3rd puzzle: The player with the lever must flip the platforms when the other player jumps to the next one.

4th puzzle: The player on the ground cannot see the colours on the tiles. When the player steps on a tile, leaving that tile will cause it to fall off. If the player steps on the tiles in the wrong order, all the tiles will fall. The player on the balcony must figure out the path where the other player can reach the coloured tiles in the order given, then the players can safely reach the door.
